

MJ 310

PC Based Controller
used for City Multi

The MJ-310 centralised PC based graphical software package allows the operator to control and monitor up to a maximum of 1000 indoor units. This software package has been designed to connect directly to the Mitsubishi City Multi system and provides an operator with all the required functionality to control and monitor the complete air conditioning system from a central location. In addition to providing a centralised control location on site, the MJ310 software can be monitored and controlled using a number of third party remote PC access software packages, e.g. PC Anywhere, using the telephone network. This ability to monitor sites remotely gives the end-user the opportunity to centralise his building control and management services, which in turn could also lead to significant cost savings.
